

2020-21 Annual Update

Asbestos waste data estimates for Australia are updated as part of national hazardous waste reporting. State and territory governments capture asbestos waste disposal data from their tracking systems. Data was provided by these governments from 2006-07 to 2020-21.

Data Limitations

States and territories record and report waste as 'asbestos waste' differently. Asbestos Containing Materials (ACMs) can be reported as wrapped ACM, and in categories such as waste or soil contaminated with ACM. For example, the ACT, SA, Tasmania and WA include only ACM (e.g. asbestos cement sheets), which is generally delivered to landfills as a package wrapped in plastic. Table 2 below summarises reported waste types collected.

National Trends

The long-term trend overall still appears to be rising levels of asbestos waste.

For example, asbestos waste in Australia has increased nationally from approximately 315,000 tonnes (in 2006-07), to 1.42 million tonnes (in 2020-21). Most asbestos waste comes from renovation and urban development, and goes to landfill.

Building and demolition waste can also be contaminated with asbestos. Contaminated soil and rubble can be included in asbestos waste totals. Further details can be found also in the [Hazardous Waste in Australia 2021 report](#).

Table 1: Summary table of all reported asbestos waste from 2006-07 to 2020-21 (tonnes per annum). This includes wrapped ACM, soil and rubble contaminated with ACM; except blue cells, which are wrapped ACM only.

	ACT	NSW	NT	Qld	SA	Tas	Vic	WA	Australia
2006-07	372	207,860	1,593	49,847	11,757	1,588	42,099	225	315,340
